

Press Release

For Immediate Release

Tassc launches Circa 2009 to help software companies save time and money

Livingston, UK – June 5, 2009 – Tassc is pleased to announce the immediate availability of a major new release of Circa. This release features significant performance enhancements providing support for estimating and planning large-scale software projects. Circa is now more configurable allowing users to refine and adjust the built-in metrics to produce ever more accurate estimates in order to control budgets and schedules.

About Circa

It is an acknowledged fact that software projects often end up out of control with escalating costs and timescales. According to the Standish Group's "CHAOS Summary 2009" report "This years results show a marked decrease in project success rates, with 32% of all projects succeeding... 44% were challenged which are late, over budget, and/or with less than the required features and functions and 24% failed which are cancelled prior to completion or delivered and never used". Circa offers a solution that directly addresses the challenges facing the software industry.

Circa is a complete visual solution for planning, estimating and controlling software projects. Circa computes fast, accurate and reliable estimates of effort, duration and cost. The user interface is highly dynamic with any changes to project scope, personnel, risk or schedule dependencies instantly reflected in numerous charts and graphs. Circa integrates with UML CASE tools and Microsoft Project. Full management reports can be produced in HTML and Microsoft Excel formats. Fixed and floating licenses are available for Windows XP and Vista platforms.
